portals paid production pilot brief

production memory pilot

prove that portals can preserve and recover the complete production history of one active ai workflow, so your team can find, understand, reproduce, and extend valuable work without rediscovery or rework.

pilot scope

A paid pilot follows a standard, customizable specification.

- referenced production-team scope
- referenced active-workflow scope
- referenced historical-project scope
- referenced participant cap
- integrations agreed before launch
- workflow review, onboarding, and final evaluation
- success criteria agreed before launch

commercial terms

before launch, we agree on exact dates, pilot owners, included projects, and annual deployment scope.

the pilot credit: if the pilot meets the success criteria and you transition to an annual agreement within the decision window, the pilot fee is credited 100% toward your first annual contract.

success criteria

the pilot is a success when your creative workflow becomes drastically faster to retrieve, explain, reproduce, and extend. We track 6 specific metrics:

- instant retrieval — A team member locates an approved asset in under 60 seconds.
- unified context — Prompts, models, and revisions live in one place, not across fragmented systems.
- infinite continuity — A creator reproduces or meaningfully extends a selected asset without starting over.
- seamless handoff — A creator who did not build the asset can understand its history.
- proven ROI — The team measures reduced rediscovery and recreation effort enough to justify the annual price.
- active adoption — At least three team members actively use Portals during the pilot duration.

final pilot review

The review produces a clear decision: deploy portals, extend under defined terms, or conclude that it is not the right fit.

- confirm whether the 48-hour milestone was achieved
- score the agreed success criteria
- identify reduced production risks and observed workflow gains
- document remaining constraints
- decide whether annual deployment is justified

security posture

- pilot repository configuration
- workflow alignment & onboarding
- pre-agreed integration setup
- guidance on context, and lineage capture
- ongoing support during the pilot duration
- final review and annual recommendation
- one named, dedicated pilot owner
- access to the selected active/historical projects
- relevant assets, prompts, references, & notes
- timely feedback during the pilot
- attendance at launch and final review
- participation from the economic buyer
